## DETAILED ACTION

### *Allowable Subject Matter*

#### **1. Claims 1-9 are allowed.**

The following is an examiner's statement of reasons for allowance: Claims 1-9 are allowed since certain key features of the claimed invention are not taught or fairly suggested by prior art. **In claim 1**, “each light emitter the array, a current modulator capable of controlling the said emitter, and comprising a source electrode, a drain electrode, a gate electrode and a trip threshold voltage, column address means capable of addressing the emitters of each column of emitters by applying a data voltage to the gate electrode of their modulators in order to control them, row select means capable of selecting the emitters of each row of emitters by applying a select voltage, compensation means for compensating for the trip threshold voltage of each modulator, wherein: the compensation means comprise at least one operational amplifier, having an inverting input, a non-inverting input and an output terminal, wherein: the non-inverting input of the operational amplifier is connected to a column address means controlling the said modulator, and the inverting input of the operational amplifier is connected to the source electrode of the said modulator, and the output of the operational amplifier being connected to the gate electrode of the said modulator, the said connections of the inverting input and of the output of this operational amplifier thus forming a feedback capable of compensating for the trip threshold voltage of the said modulator”. The closest prior art Oomura (6,693,388 B2) teaches an active matrix display includes a driving current is supplied to a light emitting element and has a voltage control current source and controlling a gate voltage of a driving current generating

transistor based on the monitor current such that a desired luminance can be realized and holding the control voltage in a capacitor; however, singularly or in combination with other prior art, fail to anticipate or render the claimed limitations, at least, "a compensation means for compensating for the trip threshold voltage of each modulator, wherein: the compensation means comprise at least one operational amplifier, having an inverting input, a non-inverting input and an output terminal, wherein: the non-inverting input of the operational amplifier is connected to a column address means controlling the said modulator, and the inverting input of the operational amplifier is connected to the source electrode of the said modulator, and the output of the operational amplifier being connected to the gate electrode of the said modulator, the said connections of the inverting input and of the output of this operational amplifier thus forming a feedback capable of compensating for the trip threshold voltage of the said modulator".

2. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
